main.py

Visualize Run

```python
#MOHAMMED SHAHID S
def find_s(training_data):
    # Initialize the specific hypothesis with the first positive instance
    hypothesis = None

    for row in training_data:
        if row[-1] == 'Yes':  # Target concept is positive
            hypothesis = row[:-1].copy()
            break

    if hypothesis is None:
        return "No positive instances found."

    # Update hypothesis based on remaining positive instances
    for row in training_data:
        if row[-1] == 'Yes':
            for i in range(len(hypothesis)):
                if row[i] != hypothesis[i]:
                    hypothesis[i] = '?'

    return hypothesis

# Example Usage
if __name__ == "__main__":
```

Output

```
Most Specific Hypothesis found by Find-S: ['Sunny', 'Warm', '?', 'Strong', '?', '?']

=== Code Execution Successful ===
```
